ISRO and NASA are jointly developing a state of art L & S band SweepSAR, referred as NISAR scheduled to be launched in 2022. The NISAR mission will provide dual frequency space-borne SAR data with high resolution, larger swath and high repeat cycle, with full-polarimetric and Interferometric modes of operation for numerous science studies and host of applications. This talk will focus on the unique features of the dual frequency NISAR as well as the various science studies and applications planned with this mission.
